#### Search Notes

Examiner Vogel,

Here are the results of the search you requested.

Please feel free to contact me if you have any questions.

**Edward Hart**

To:

STIC-Biotech/ChemLib

Subject:

sequence search for 09/896,888

please do sequence search of SEQ ID NO:1, nucleotides 351-527 of SEQ ID NO:1, and SEQ ID NO:10, including interference files,

of 09/896,888

and return results to me on paper asap.

Thanks

## Voluntary Results Feedback Form

| >   | I am an examiner in Workgroup: Example: 1610   |
|-----|--|
| >   | Relevant prior art found, search results used as follows:  |
|     | 102 rejection  |
|     | ☐ 103 rejection  |
|     | ☐ Cited as being of interest.  |
|     | ☐ Helped examiner better understand the invention.   |
|     | ☐ Helped examiner better understand the state of the art in their technology.                    |
|     | Types of relevant prior art found:   |
|     | ☐ Foreign Patent(s)  |
|     | Non-Patent Literature (journal articles, conference proceedings, new product announcements etc.) |
| >   | Relevant prior art not found:  |
|     | Results verified the lack of relevant prior art (helped determine patentability).                |
|     | Results were not useful in determining patentability or understanding the invention.             |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     * NOTE: This record contains 111 individual
* sequencing reads that have not been assembled into
* contigg. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 contig of 827 bp in length gap of 100 bp contig of 799 bp in length gap of 100 bp contig of 809 bp in length gap of 100 bp contig of 812 bp in length gap of 100 bp contig of 777 bp in length contig of 777 bp in length

------ Genome Center Center: Whitehead Institute/ MIT Center for Genome Research sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows Contact: sequence\_submissions@genome.wi.mit.edu ------ Project Information NOTE: This record contains 124 individual Center clone name: 348 B 6 Center project name: L3764

* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100 bp - 100 bp in length 100 bp in length 200 883 bp in length

J., Zimmer, A. and Zody, M.  Direct Submission Submitted (123-SEP-1999) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA All ropeats were identified using RepeatMasker: Smit, A.F.A. & Green, P. (1996-1997) Http://ftp.genome.washington.edu/RM/RepeatMasker: tml.  * NOTE: This record contains 86 individual * sequencing reads that have not been assembled into * onoties. Runs of N are used to separate the reads * and the order in which they appear is completely * arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-ritch and allows * overlap relationships among clones to be deduced. * However, it should not be assumed that this clone * will be sequenced to completion. In the event that * the record is updated, the accession number will   | d of 859 bp in length of 20,836 bp in length of 836 bp in length of 851 bp in length of 852 bp in length of 852 bp in length of 852 bp in length of 855 bp in length of 855 bp in length of 865 bp in length of 900 bp in length of 900 bp in length of whown length of whown length of 867 bp in length of 867 bp in length of 867 bp in length of 868 bp | of 845 bp in length unknown length of 847 bp in length of 854 bp in length unknown length of 855 bp in length unknown length of 855 bp in length unknown length of 859 bp in length unknown length of 871 bp in length unknown length of 819 bp in length unknown length unknown length unknown length of 819 bp in length unknown length of 817 bp in length unknown length of 817 bp in length unknown length unknown length unknown length of 817 bp in length unknown length unknown length of 886 bp in length unknown length of 886 bp in length unknown length of 887 bp in length unknown length of 887 bp in length unknown length unknown length unknown length of 817 bp in length unknown length of 817 bp in length unknown length of 817 bp in length unknown length   |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Anotes—Wortor: milMp19 with added BstXI site; V-type: Phage; Genomic DNA from a single adult Zebrafish of AB strain was digested with Alu1, Cac21, HaelII, NlaVI, or Rsal. Fragments in the range of 250-500 bp were gal purified and a BstXI linker was added. The fragments were closed into a modified Milmp19 vector and transformed into B. COli Mislapha. Microsatelllite sequences were screened with labeled d(CA)15 and d(GT)15 oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PAT 17-JUL-2003

/lab_host="Vector: ml3MP19 with added BstXI site; V-type:
Phage; Genomic DNA from a single adult Zebrafish of AB
strain was digested with AluI, Cac8I, HaeIII, NlaVI, or
RsaI. Fragments in the range of 250-500 bp were gel ,
purified and a BstXI linker was added. The fragments were
cloned into a modified Ml3Mp19 vector and transformed
into B. Coli DH5alpha. Microsatelllite sequences were
screened with labeled d(CA)15 and d(GT)15 oligonucleotide

/note="Vector: mi3MP19 with added BstXI site; V-type:
Phage; Genomic DNA from a single adult Zebrafish of AB
strain was digested with Alu!, Cac81, HasII, NINIV, or
Rsal. Fragments in the range of 250-500 bp were gel
purified and a BstX1 linker was added. The fragments were
cloned into a modified Mi3mp19 vector and transformed
into B. COli MBSalpha. Microsatelllite sequences were
screened with labeled d(CA)15 and d(GT)15 oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  * NOTE: This record contains 86 individual
sequencing reads that have not been assembled into
contigs. Runs of N are used to separate the reads
and the order in which they appear is completely
rarbitrary. Low-pass sequence sampling is useful for
identifying clones that may be gene-rich and allows
overlap relationships among clones to be deduced.
However, it should not be assumed that this clone
will be sequenced to completion. In the event that
the record is updated, the accession number will
be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ------ Genome Center

* sequencing reads that have not been assembled into
contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
identifying clones that may be gene-rich and allows
overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
the record is updated, the accession number will
                                                                                                                                                                                    ;

Primers AAV62497 and AAV62498 were used for the construction of the plasmid p2ZOp3J-3. The invention provides a new shuttle vector for transforming insect cells that comprises: (i) prokaryotic origin of replication; (ii) insect promoter having homology to, and capable of functioning as, an immediate early baculovirus promoter; (iii)

          conferring resistance to a bloomycin/phleomycin-type antibiotic under transcriptional control of (ii) and (iii), in insect and prokaryotic cells respectively. The vectors can be used to stably transform (especially insect) cells with heterologous DNA, is useful to allow study of gene expression and direct expression of heterologous products, such as commercially important proteins. They are especially useful to allow expression of melanotransferrins, ion transport peptide hormones or biologically active derivatives in insect cells. They enable transformation of insect cell in insect cells. They enable screening of lines for optimum post-translational modification of
                                                                                                                                                                                  particular proteins. Shuttle vectors further comprising DNA transposable elements defining a transposon can be used to optimise heterologous

```

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridastion probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is

Claim 1; SEQ ID NO 25782; 103pp; English.

useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food

activity of useful for g

(I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed senes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) are useful for treating disorders
supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this printed specification, but was obtained in

2000-499225/44. P-PSDB; AAB25691. New isolated polynucleotide encoding a secreted protein useful for preventing, treating or ameliorating a medical condition.

Claim 1; Page 394; 451pp; English.

The polynucleotide sequences given in AAA87666 to AAA87708 encodes the human secreted proteins given in AAB25665 to AAB25755. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Examples of activities include: immunosuppressive; immunostimulant; antiinflammatory; cardiant; vulnerary; antilucer; nootropic; antiviral; anticonvulsant; antiparkinsonian; neuroprotective; antibacterial; anticonvulsant; antiparkinsonian; neuroprotective; antiarteriosclerotic and cytostatic. The secreted proteins and their polynucleotides can be used in gene therapy and as vaccines, chemotaxismodulators and angiogenesis-modulators. The human secreted proteins and

Further disclosed is an antibody that binds to the polypeptide of the invention. The activity of the polypeptide of the invention may be described as cytostatic. The antibody is useful for electecting the presence of (I) in a sample. Nucleic acid molecules of the invention are useful in the detection of breast tumours. (I) is useful as a marker for breast cancer and in breast cancer therapy. Sequences given in records ACN7881-ACN2934 represent nucleic acid markers associated with breast cancer. Note: The sequence listing does not form part of the specification but may be obtained in electronic format from the USPTO web
                                                                                                                                            infection. AAA87657 to AAA87665 and AAB25664 represent sequences
polynucleotides can be used for diagnosing (the susceptibility to) a pathological condition by determining the presence or absence of a mutation in the polynucleotide or determining the presence or amount of expression of the protein. The polynucleotides and proteins can also be used in the treatment and diagnosis of cancer, diseases of the immune system, hyperproliferative disorders, cardiovascular disorders and neurological disease. They can also be used to promote wound healing and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated polypeptide (I) associated with breast cancer which is encoded by a nucleic acid molecule comprising a nucleotide sequence (SI). Purther disclosed is an antibody that binds to the polypeptide of the invention. The activity of the polypeptide of the invention may be described as cytostatic. The antibody is useful for detecting the presence of (I) in a sample. Nucleic acid molecules of the invention are useful in the detection of breast tumours. (I) is useful as a marker for breast cancer and in breast cancer therapy. Sequences given in records ACN7851-ACN92934 represent nucleic acid markers associated with breast cancer. Note: The sequence listing does not form part of the specification but may be obtained in electronic format from the USPTO web

net positive or net negative charge during sequencing. The recombinant thermostable DNA polymerases are useful in many recombinant DNA techniques, e.g. nucleic acid amplification by polymerase chain reaction, self-sustained sequence replication, or high temperature DNA sequencing. The recombinant thermostable DNA polymerases are also useful in increasing the uniformity of dye-terminator incorporation in fluorescent dye DNA sequencing. The present sequence represents a sequence obtained after sequencing with a modified Tag DNA polymerase of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polymerases having an amino acid substitution at E681. The new DNA bolymerases have improved discrimination properties (and thus resulting in improved signal uniformity) and increased tolerance to high salt conditions. They also modulate the incorporation of terminators having a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New purified recombinant thermostable DNA polymerases having amino acid substitutions at E410R or E681R, useful in recombinant DNA techniques, e.g. nucleic acid amplification or high temperature DNA sequencing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          specification describes new purified recombinant thermostable DNA

The invention relates to nucleic acid markers which are overexpressed in cancer cells as compared to their expression in normal (i.e. non-cancerous) ovarian cells. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the necoded by the markers, antibodies that selectively bind to the polypeptides.

CC polypeptides, a method of inhibiting ovarian cancer in a patient at risk of developing ovarian cancer involving inhibiting expression of a gene corresponding ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient an antisense oligonuclecide complementary to a marker of the invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer sample. A difference between the marker in a patient sample and a normal level of expression of a marker in a patient sample and an ormal level of expression of a marker or sorresponds to a secreted protein or a transcribed capture corresponds to a secreted protein or a transcribed sample or its portion. The level of expression of the marker is assessed by detecting the presence of protein or protein fragment is detected using an antibody that specifically binds with the protein or protein the answer is assessed by detecting the presence of a transcribed to the marker is a specifically binds with the protein or protein the answer is a seeses of by detecting the presence of a transcribed to the marker is a specifically binds with the protein or protein the marker is a specifical section of the presence of a transcribed to the marker is a specifical to the marker is a transcribed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        polynucleotide which anneals with the marker or anneals with a portion of the polynucleotide comprising the marker, under stringent conditions. The marker is also used for monitoring the progression of ovarian cancer in a patient which involves detecting expression of the marker in a patient sample at a first point in time, repeating the method at a subsequent time and comparing the level of expression. The method is carried out
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     using an ovarian tissue sample. A composition comprising a marker, polypeptide or antibody of the invention is used to treat ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                     Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a human ovarian cancer DNA marker of the

The invention relates to isolated polynucleotide (I) and polypeptide (II)

sequences. (I) is useful as hybridisation probes, polymerase chain

reaction (PCR) primers, oligomers, and for chromosome and gene mapping,
and in recombinant production of (II). The polynucleotides are also used
in diagnostics as expressed sequence tags for identifying expressed
genes. (I) is useful in gene therapy techniques to restore normal
cativity of (II) or to treat disease states involving (II). (II) is
useful for generating antibodies against it, detecting or quantitating a
polypeptide in tissue, as molecular weight markers and as a food
csupplement. (II) and its binding partners are useful in medical imaging
cc supplement. (II) and its binding partners are useful in medical imaging
involving aberrant protein expression or biological activity. The
polypeptide and polynucleotide sequences have applications in
diagnostics, forensics, gene mapping, identification of mutations
responsible for genetic disorders or other trails to assess biodiversity
and to produce other types of data and products dependent on DNA and
anino acid sequences. Assessed trainers the products dependent on DNA and
anino acid sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   pupplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             amino acid sequences. AAS94197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and to produce other types of data and products dependent on DNA and

```
The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain recardion (PCR) primers, ollowers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cutivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of sites captered betwee applications in disorders of sites foremsics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and conding sequences. Abs64197-Abs94564 represent novel human diagnostic coding sequences. Abs64197-Abs94564 represent novel human diagnostic coding sequences. Abs64197-Abs94564 represent novel human diagnostic coding sequences. Absention, Note: The sequence data for this electronic format directly from WIPO at the vivolint was obtained in electronic format directly from WIPO at the vivolint was obtained in electronic format directly from WIPO at the vivolint was obtained in the printed specification.
                                                                                                                                                                                                                                                                                                                                               New isolated polynucleotide and encoded polypeptides, useful in
diagnostics, forensics, gene mapping, identification of mutations
responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score 35.6; DB 5; Length 2424; Pred. No. 9.7e-05;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to isolated polynucleotide (I) and polypeptide (II)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            in diagnostics as expressed sequence the providentifying expressed activity of (II) or to treat disease states involving (II). (II) is useful in or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging involving aberrant protein expression or biological activity. The polypeptide and polymuclocitide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and to produce other types of data and products dependent on DNA and and anino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. You sequence data for this patent did not appear in the printed specification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                     New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; chromosome mapping; gene mapping; gene therapy; forensic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  à
                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed carrivity of (II) is useful in gene therapy techniques to restore normal carrivity of (II) to to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a useful for senerating and its binding partners are useful in medical imaging consupplement. (II) and its binding partners are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in calculations, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and cannot acquences of the invention. Note: The sequence data for this calculation for mit or the printed specification, but was obtained in electronic format, directly from NIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

```
The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to genetic disorders. The present DNA sequences in patients to identify potential exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        analysis, characterization or therapeutic use, or as markers for tissues
in which the corresponding protein is preferentially expressed.
                                                                                                                                                                                                                                                          Wang J;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
